INTRODUCTION

Problems may come from any direction such as women walking on the road after the work, going to super market or many other reasons for which they go alone.

Our prototype give an overview on a security system that providing security and safety to women so that they never feel helpless while facing such social challenges.

To minimize chances in becoming a victim of violent crime and to help you out of unsafe using safety shoes and system we proposed.

Hence, FindME, a tracking device is introduced to reduces the risk by identifying the location of person who is in danger to ensure the safety.

OBJECTIVE

By tracking the location of women's shoes, authorities can be alerted to potential emergencies and provide timely assistance.

to minimize chances in becoming a victim of violent crime is to identify and call on resources to help you out of unsafe situations.

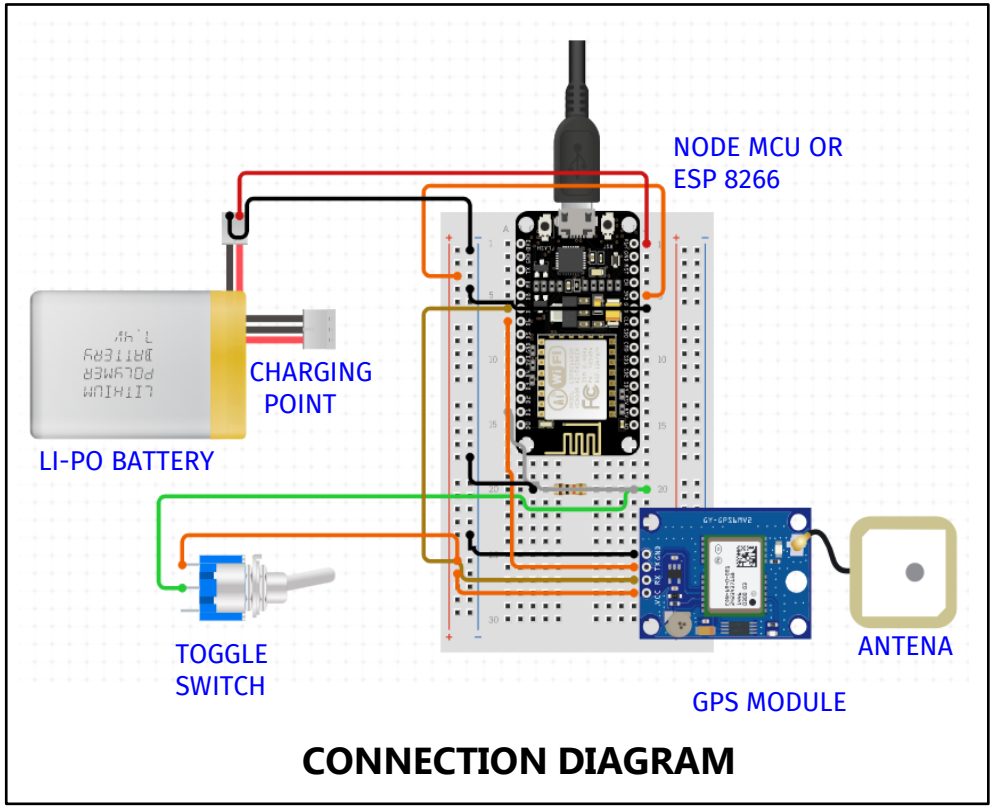

easy to use and comfortable as compared with already existing women security solutions such as a separate garment, bulky belts and mobile sos that are just very abstract and obsolete.

To deterring and preventing violence, tracking shoes can also help to empower women and make them feel safer in their communities.

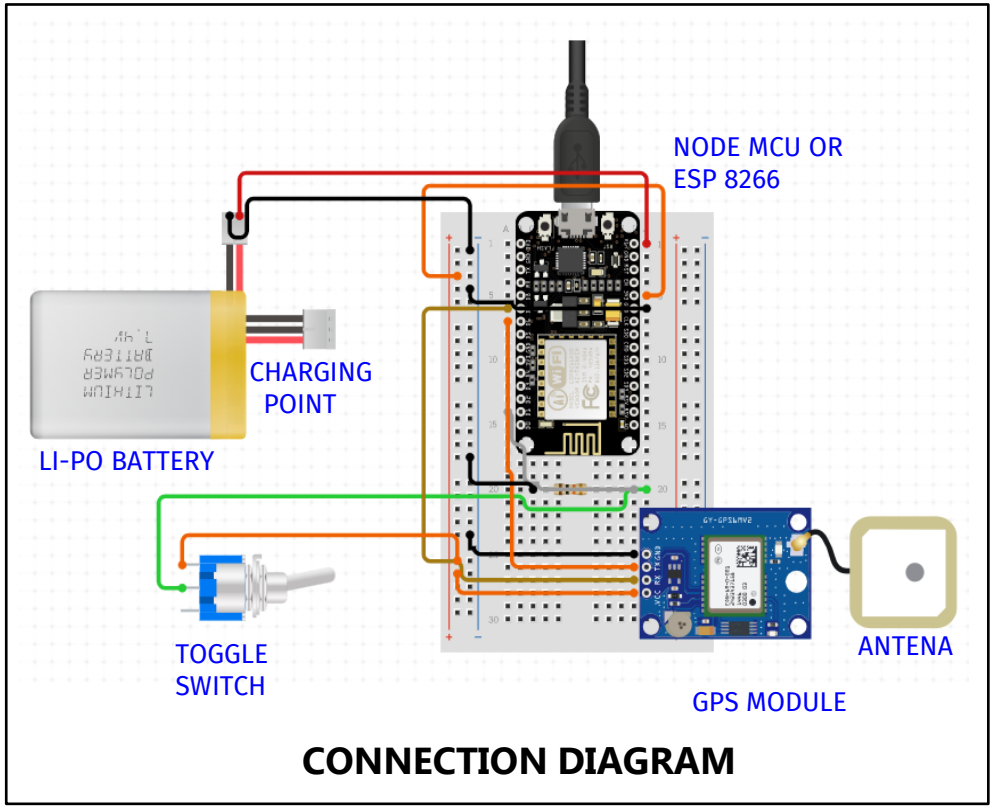

SOFTWARE AND HARDWARE COMPONENT

- VS Code
- Arduino IDE
- GOOGLE Cloud
- FindMe

WORKING

After triggering the node MCU... It generated the latitude and longitude from the Neo 6M GPS Module.

After getting the latitude and longitude.. Node MCU send the data to the web server to generate the current location.

From console.cloud.google.com we get the api key for geocoding api, geolocation api, map javascript api, placed api, direction api.

According to the api key we got the current location, the place and the direction to reach that place.

APPLICATION

This shoes is used to track the wearer's location in real time when the person is in danger.

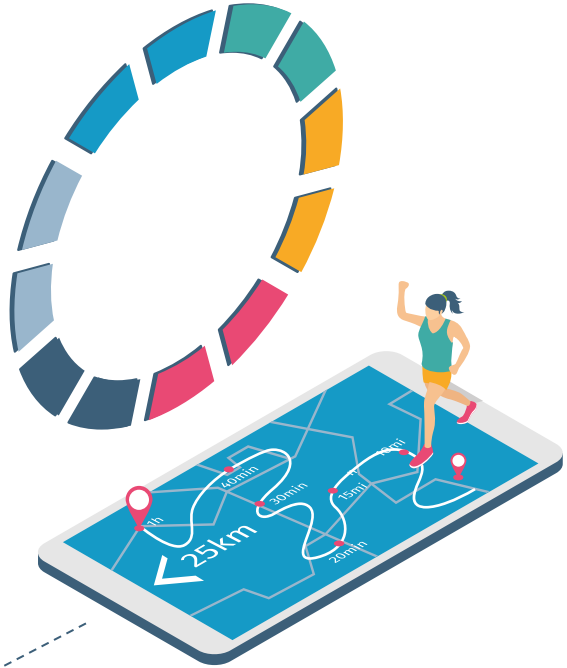

This Information will be shared with nearest police station and family through Gmail.

Parents can use safety tracking devices to monitor the location of their children in real-time, ensuring their safety.

Individuals engaged in outdoor activities can use safety tracking devices to share their location with others or signal for help in case of emergencies.

Tracking shoes can be used to create geofences. If the wearer crosses a geofence, the shoes can send an alert to trusted contacts.

Overall, tracking shoes is valuable tools by providing real-time location tracking to women stay safe.

FUTURE SCOPE

Fall detection

Tracking shoes can be equipped with sensors to detect fall and can send emergency alert.

Audio & video

Audio mic and the camera module will be implemented to get the footage and voice as a clue during the crime.

Panic Button

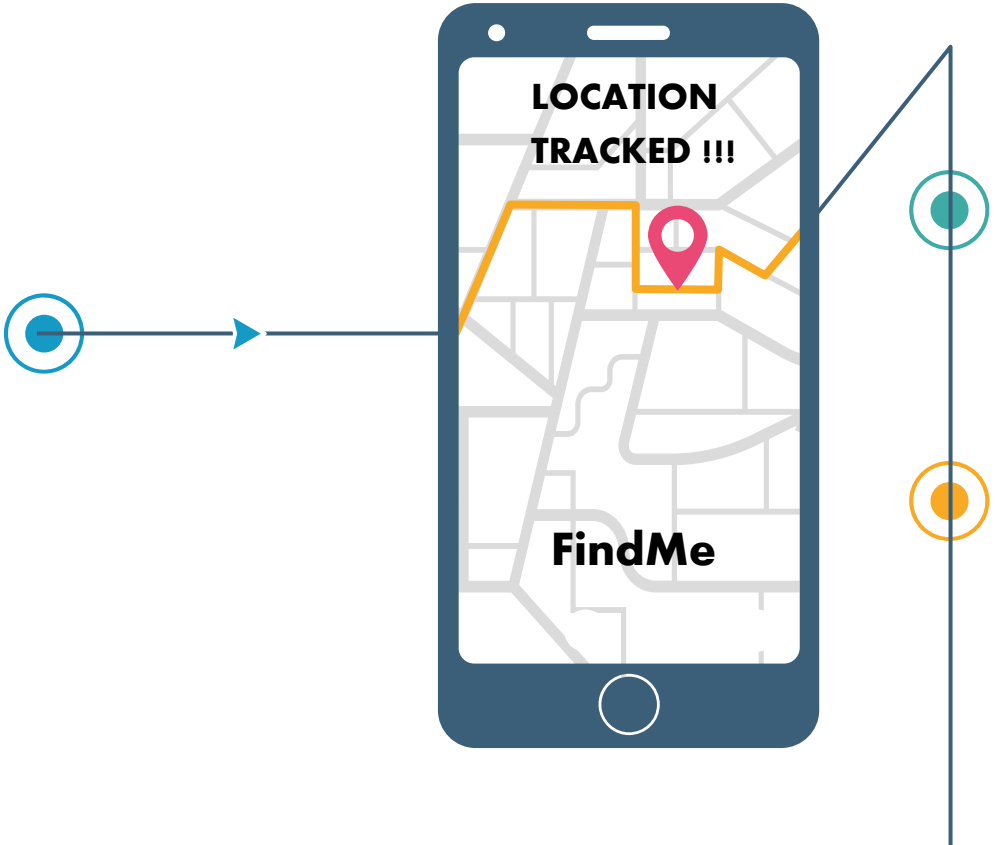

Tracking shoes can be equipped with a panic button that the wearer can press in an emergency.

Power source

We will try to improve the power sources using solar pannel.

CONCLUSION

End the conclusion with final remarks, expressing the overall significance of the study and its potential to contribute to advancements in safety technology. Conclude with a call to action, encouraging further exploration and adoption of safety tracking devices.

THANK YOU
